Covariance Sensitivity Proofs

March 21, 2020

1 PRELIMINARIES

Lemma 1. $\forall i$,

$$\sum_{j=1}^{n}(x_{ji} - \bar{X}_i) = 0.$$

Proof.

$$\sum_{i=1}^{n}(x_{ji} - \bar{X}_i) = \sum_{i=1}^{n} x_{ji} - n\bar{X}_i$$

$$= \sum_{i=1}^{n} x_{ji} - n\left(\frac{1}{n}\sum_{i=1}^{n} x_{ji}\right)$$

$$= 0.$$

$\square$

Lemma 2. *Let*

$$f_{ij} = \sum_{k=1}^{n}(x_{ki} - \bar{X}_i)(x_{kj} - \bar{X}_j),$$

and let $X_i' = X_i \cup \{y_i\}$, and say X_i has size n. Let $\bar{X}_i'$ and $\bar{X}_j'$ be the sample means of X_i' and X_j' respectively. Then,

$$f_{ij}(X') = f_{ij}(X) + n(\bar{X}_i - \bar{X}_i')(\bar{X}_j - \bar{X}_j') + (y_i - \bar{X}_i)(y_j - \bar{X}_j).$$

Proof. Note that

$$f_{ij}(X') = \sum_{k=1}^{n+1}(x'_{ki} - \bar{X}'_i)(x'_{kj} - \bar{X}'_j),$$

$$= \sum_{k=1}^{n}(x_{ki} - \bar{X}'_i)(x_{kj} - \bar{X}'_j) + (y_i - \bar{X}'_i)(y_j - \bar{X}'_j),$$

$$= \sum_{k=1}^{n}\left((x_{ki} - \bar{X}_i) + (\bar{X}_i - \bar{X}'_i)\right)\left((x_{kj} - \bar{X}_j) + (\bar{X}_j - \bar{X}'_j)\right) + (y_i - \bar{X}'_i)(y_j - \bar{X}'_j),$$

$$= \sum_{k=1}^{n}(x_{ki} - \bar{X}_i)(x_{kj} - \bar{X}_j) + (\bar{X}_j - \bar{X}'_j)\sum_{k=1}^{n}(x_{ki} - \bar{X}_i) + (\bar{X}_i - \bar{X}'_i)\sum_{k=1}^{n}(x_{kj} - \bar{X}_j),$$

$$+ \sum_{k=1}^{n}(\bar{X}_i - \bar{X}'_i)(\bar{X}_j - \bar{X}'_j) + (y_i - \bar{X}'_i)(y_j - \bar{X}'_j),$$

$$= f_{ij}(X) + n(\bar{X}_i - \bar{X}'_i)(\bar{X}_j - \bar{X}'_j) + (y_i - \bar{X}'_i)(y_j - \bar{X}'_j),$$

where the cancellation of the second and third terms in the second-to-last line is due to Lemma 1. □

Lemma 3. *Let X_i have size n and say $X'_i = X_i \cup \{y_i\}$ where $y_i \in \mathcal{X}_i$. Say that the space of datapoints $\mathcal{X}_i$ is bounded above by M_i and bounded below by m_i, and let $y_i \in \mathcal{X}_i$. Let $\bar{X}_i$, $\bar{X}_j$, $\bar{X}'_i$, and $\bar{X}'_j$ be the sample means of X_i, X_j, X'_i and X'_j respectively. Then,*

$$n\left|(\bar{X}_i - \bar{X}'_i)(\bar{X}_j - \bar{X}'_j)\right| \leq \frac{n}{(n+1)^2}(M_i - m_i)(M_j - m_j).$$

Proof. Note that

$$n\left|(\bar{X}_i - \bar{X}'_i)(\bar{X}_j - \bar{X}'_j)\right| = n\left|\left(\frac{1}{n}\sum_{k=1}^{n}x_{ki} - \frac{1}{n+1}\sum_{k=1}^{n+1}x'_{ki}\right)\left(\frac{1}{n}\sum_{k=1}^{n}x_{kj} - \frac{1}{n+1}\sum_{k=1}^{n+1}x'_{kj}\right)\right|,$$

$$= n\left|\left(\left(\frac{1}{n} - \frac{1}{n+1}\right)\sum_{k=1}^{n}x_{ki} - \frac{y_i}{n+1}\right)\left(\left(\frac{1}{n} - \frac{1}{n+1}\right)\sum_{k=1}^{n}x_{kj} - \frac{y_j}{n+1}\right)\right|,$$

$$= n\left|\left(\frac{1}{n(n+1)}\sum_{k=1}^{n}x_{ki} - \frac{y_i}{n+1}\right)\left(\frac{1}{n(n+1)}\sum_{k=1}^{n}x_{kj} - \frac{y_j}{n+1}\right)\right|,$$

$$= \frac{n}{(n+1)^2}\left|\left(\frac{1}{n}\sum_{k=1}^{n}x_{ki} - \frac{y_i}{n+1}\right)\left(\frac{1}{n}\sum_{k=1}^{n}x_{kj} - \frac{y_j}{n+1}\right)\right|,$$

$$\leq \frac{n}{(n+1)^2}(M_i - m_i)(M_j - m_j).$$

□

Lemma 4. *Let X_i have size n and say $X'_i = X_i \cup \{y_i\}$ where $y_i \in \mathcal{X}_i$. Say that the space of datapoints $\mathcal{X}_i$ is bounded above by M_i and bounded below by m_i, and let $y_i \in \mathcal{X}_i$. Let $\bar{X}_i$, $\bar{X}_j$, $\bar{X}'_i$, and $\bar{X}'_j$ be the sample means of X_i, X_j, X'_i and X'_j respectively. Then,*

$$\left|(y_i - \bar{X}'_i)(y_j - \bar{X}'_j)\right| \leq \frac{n^2}{(n+1)^2}(M_i - m_i)(M_j - m_j).$$

Proof. Note that

$$
\begin{aligned}
\left|(y_i - \bar{X}'_i)(y_j - \bar{X}'_j)\right| &= \left|\left(y_i - \frac{y_i + n\bar{X}_i}{n+1}\right)\left(y_j - \frac{y_j + n\bar{X}_j}{n+1}\right)\right|, \\
&= \frac{1}{(n+1)^2}\left|\left((n+1)y_i - y_i - n\bar{X}_i\right)\left((n+1)y_j - y_j - n\bar{X}_j\right)\right|, \\
&= \frac{n^2}{(n+1)^2}\left|(y_i - \bar{X}_i)(y_j - \bar{X}_j)\right|, \\
&\leq \frac{n^2}{(n+1)^2}(M_i - m_i)(M_j - m_j).
\end{aligned}
$$

$\square$

2 Neighboring Definition: Add/Drop One

2.1 ℓ_1-sensitivity

Theorem 1. *Let*

$$
f_{ij}(X) = \sum_{k=1}^{n}(x_{ki} - \bar{X}_i)(x_{kj} - \bar{X}_j).
$$

Say that the space of datapoints $\mathcal{X}_i$ is bounded above by M_i and bounded below by m_i. Then the The ℓ_1-sensitivity of $f(\cdot)$ is bounded by

$$
\frac{n}{(n+1)}(M_i - m_i)(M_j - m_j).
$$

Proof. Adding a point:

$$
\begin{aligned}
\left|f_{ij}(X') - f_{ij}(X)\right| &= \left|n(\bar{X}_i - \bar{X}'_i)(\bar{X}_j - \bar{X}'_j) + (y_i - \bar{X}_i)(y_j - \bar{X}_j)\right| & \text{(By Lemma 2)} \\
&\leq n\left|(\bar{X}_i - \bar{X}'_i)(\bar{X}_j - \bar{X}'_j)\right| + \left|(y_i - \bar{X}_i)(y_j - \bar{X}_j)\right| \\
&\leq \frac{n}{(n+1)^2}(M_i - m_i)(M_j - m_j) + \frac{n^2}{(n+1)^2}(M_i - m_i)(M_j - m_j) \\
& & \text{(By Lemmas 3 and 4)} \\
&= \frac{n}{(n+1)}(M_i - m_i)(M_j - m_j). & (2.1)
\end{aligned}
$$

Removing a point:
Note that Lemma 2 can be rewritten to this setting by parametrizing n as $n-1$ and swapping X and X' in its expression:

$$
f_{ij}(X) = f_{ij}(X') + (n-1)(\bar{X}'_i - \bar{X}_i)(\bar{X}'_j - \bar{X}_j) + (y_i - \bar{X}'_i)(y_j - \bar{X}'_j).
$$

Note that Lemmas 3 and 4 may be rewritten with the same reparametrization:

$$
(n-1)\left|(\bar{X}'_i - \bar{X}_i)(\bar{X}'_j - \bar{X}_j)\right| \leq \frac{n-1}{n^2}(M_i - m_i)(M_j - m_j),
$$

and

$$
\left|(y_i - \bar{X}'_i)(y_j - \bar{X}'_j)\right| \leq \frac{(n-1)^2}{n^2}(M_i - m_i)(M_j - m_j).
$$

Then,

$$\begin{aligned}
\left| f_{ij}(X) - f_{ij}(X') \right| &= \left| (n-1)(\bar{X}'_i - \bar{X}_i)(\bar{X}'_j - \bar{X}_j) + (y_i - \bar{X}'_i)(y_j - \bar{X}'_j) \right|, \\
&\leq \left| (n-1)(\bar{X}'_i - \bar{X}_i)(\bar{X}'_j - \bar{X}_j) \right| + \left| (y_i - \bar{X}'_i)(y_j - \bar{X}'_j) \right|, \\
&\leq \frac{n-1}{n^2}(M_i - m_i)(M_j - m_j) + \frac{(n-1)^2}{n^2}(M_i - m_i)(M_j - m_j), \\
&= \frac{n-1}{n}(M_i - m_i)(M_j - m_j).
\end{aligned} \tag{2.2}$$

Note that for any $n \geq 1$,
$$\frac{n}{n+1} > \frac{n-1}{n}. \tag{2.3}$$

So, the worst-case bound always occurs in the "add-one" case, and in general the ℓ_1 sensitivity of $f(\cdot)$ is bounded by

$$\frac{n}{(n+1)}(M_i - m_i)(M_j - m_j).$$

$\square$

Corollary 1. *The ℓ_1-sensitivity of sample covariance is bounded by*

$$\frac{n}{(n^2-1)}(M_i - m_i)(M_j - m_j).$$

2.2 ℓ_2-sensitivity

Theorem 2. *Sample covariance has ℓ_2 sensitivity bounded above by*

$$\left(\frac{n}{(n^2-1)}(M_i - m_i)(M_j - m_j) \right)^2.$$

Proof. $\square$

3 Neighboring Definition: Change One

3.1 ℓ_1-sensitivity

3.2 ℓ_2-sensitivity
